Understanding RBF Neural

Networks

What is an RBF Neural Network?

An RBF neural network is a type of feedforward neural network that uses radial basis functions as activation functions. It typically consists of three layers:

1. **Input Layer:** Receives the data features.
2. **Hidden Layer:** Applies radial basis functions (usually Gaussian functions) to transform inputs into a higher-dimensional space.
3. **Output Layer:** Produces the final prediction or classification result.

Advantages of RBF Networks

1. Fast training due to the local receptive fields of the radial basis functions.
2. Good approximation capabilities for nonlinear functions.
3. Ease of interpretation and visualization.
4. Robust to noisy data if properly trained.

Implementing RBF Neural Network in MATLAB: An Overview

Key Steps in Developing RBF Neural Network Source Code

1. Data Preparation: Collect and preprocess data for training and testing.
2. Center Selection: Determine the centers of the radial basis

- functions, typically using clustering algorithms like K-means.
3. Compute Spread (Width): Calculate the width parameter for the Gaussian functions.
 4. Training the Network: Calculate the weights connecting hidden layer to output layer, often through linear regression.
 5. Validation and Testing: Evaluate the network's performance on unseen data.
 6. Deployment: Use the trained network for actual predictions.

Sample MATLAB Source Code for RBF Neural Network

Step 1: Data Preparation

Before initializing the RBF network, load or generate your dataset. For example:

```
% Generate sample data for regression
x = linspace(-10, 10, 200)';
t = sin(x) + 0.1*randn(size(x));
% Split data into training and testing sets
train_idx = 1:150;
test_idx = 151:200;

x_train = x(train_idx);
t_train = t(train_idx);
x_test = x(test_idx);
t_test = t(test_idx);
```

Step 2: Selecting Centers Using K-means Clustering

Centers are pivotal for RBF networks. Using K-means helps find representative centers in the input space.

```
% Define number of centers
num_centers = 10;

% Use k-means to find centers
[centers, ~] = kmeans(x_train, num_centers);
```

Step 3: Calculating Spreads (Widths)

Calculate the spread (standard deviation) for each RBF based on the centers.

```
% Calculate the spread (sigma)
dists = pdist2(centers, centers);
sigma = mean(dists(:)) / sqrt(2 * num_centers);
```

Step 4: Constructing the RBF Layer

Compute the activation of each RBF neuron for training data.

```
% Define Gaussian RBF function
rbf = @(x, c, s) exp(-norm(x - c)^2 / (2 * s^2));

% Build hidden layer output matrix
H = zeros(length(x_train), num_centers);
for i = 1:length(x_train)
```

```

        for j = 1:num_centers
            H(i,j) = rbf(x_train(i), centers(j), sigma);
        end
    end
end

```

Step 5: Calculating Output Weights

Use linear regression or Moore-Penrose pseudoinverse to determine weights.

```

% Calculate weights using pseudo-inverse
W = pinv(H) t_train;

```

Step 6: Making Predictions and Evaluating

Apply the trained network to test data and evaluate performance.

```

% Compute hidden layer output for test data
H_test = zeros(length(x_test), num_centers);
for i = 1:length(x_test)
    for j = 1:num_centers
        H_test(i,j) = rbf(x_test(i), centers(j), sigma);
    end
end

% Predict outputs
t_pred = H_test W;

% Plot results
figure;

```

```
plot(x_test, t_test, 'b', 'LineWidth', 1.5);  
hold on;  
plot(x_test, t_pred, 'r--', 'LineWidth', 1.5);  
legend('Actual', 'Predicted');  
xlabel('Input x');  
ylabel('Output t');  
title('RBF Neural Network Regression Results');  
grid on;
```

Optimizing RBF Neural Networks in MATLAB

3. Center Selection: Use advanced clustering or optimization algorithms.
4. Regularization: Incorporate regularization techniques to prevent overfitting.

Using MATLAB Toolboxes and Functions

MATLAB offers built-in functions and toolboxes such as the Neural Network Toolbox that can simplify RBF network implementation:

1. `fitrnet`: For regression tasks.
2. `newrb`: Creates and trains RBF networks automatically.

Using MATLAB's Built-in Function `newrb` for RBF Networks

The `newrb` function streamlines the creation of RBF neural networks by automating center selection, spread calculation, and training. Here is an example:

```
% Using MATLAB's newrb function
net = newrb(x_train', t_train', goal=0.01, spread=1,
max_neurons=50, displayFrequency=10);

% Predict on test data
t_pred = net(x_test');

% Plot results

plot(x_test, t_test, 'b', 'LineWidth', 1.5);
hold on;
plot(x_test, t_pred, 'r--', 'LineWidth', 1.5);
legend('Actual', 'Predicted');
xlabel('Input x');
ylabel('Output t');
