ANSWER KEY

Nervous System Study Guide Answer Key Understanding the nervous system is fundamental for students pursuing biology, medicine, or health sciences. A well-structured nervous system study guide answer key serves as an invaluable resource to review key concepts, clarify doubts, and prepare effectively for exams. This comprehensive guide aims to provide clear, detailed answers to common questions about the nervous system, ensuring learners grasp both the foundational and complex aspects of this vital biological system.

Overview of the Nervous System

What Is the Nervous System?

The nervous system is a complex network of nerve cells (neurons) and supporting tissues that coordinate all the activities of the body. It allows organisms to respond to internal and external stimuli, maintain homeostasis, and enable functions like movement, sensation, thought, and emotion.

Major Components of the Nervous System

The nervous system is divided into two main parts:

1. **Central Nervous System (CNS):** Comprising the brain and spinal cord, it processes information received from the body and generates responses.
2. **Peripheral Nervous System (PNS):** Consisting of nerves outside the CNS, it transmits sensory information to the CNS and carries out motor commands.

Neurons and Neuroglia

What Are Neurons?

Neurons are the fundamental units of the nervous system responsible for transmitting electrical signals. They have specialized structures:

1. **Cell Body (Soma):** Contains the nucleus and metabolic machinery.
2. **Dendrites:** Receive signals from other neurons.
3. **Axon:** Conducts electrical impulses away from the cell body.
4. **Axon Terminals:** Release neurotransmitters to communicate with other neurons or muscles.

What Are Neuroglia?

Neuroglia, or glial cells, support and protect neurons. Types include:

1. **Astrocytes:** Maintain the blood-brain barrier and provide nutrients.
2. **Oligodendrocytes:** Form myelin sheaths in the CNS.
3. **Schwann Cells:** Myelinate neurons in the PNS.

4. **Microglia:** Act as immune cells in the nervous system.

Neural Transmission and Synapses

How Do Neurons Communicate?

Neurons communicate through electrical impulses called action potentials. When a neuron is stimulated beyond a threshold, an action potential is generated and travels along the axon.

What Is a Synapse?

A synapse is the junction between two neurons or a neuron and an effector cell. It can be:

1. **Electrical Synapse:** Direct electrical communication (less common).
2. **Chemical Synapse:** Uses neurotransmitters to transmit signals across the synaptic cleft.

Neurotransmitters and Their Functions

Neurotransmitters are chemicals that carry signals across synapses. Examples include:

1. **Acetylcholine:** Involved in muscle activation and memory.
2. **Serotonin:** Regulates mood and sleep.
3. **Dopamine:** Associated with reward and pleasure.
4. **GABA:** The primary inhibitory neurotransmitter.

Types of Nervous System Functions

Sensory (Afferent) Division

This division carries sensory information from receptors to the CNS, allowing the body to perceive stimuli like touch, temperature, pain, and proprioception.

Motor (Efferent) Division

Transmits commands from the CNS to muscles and glands to produce responses. It has two subdivisions:

1. **Somatic Nervous System:** Controls voluntary movements.
2. **Autonomic Nervous System:** Regulates involuntary functions like heart rate, digestion, and respiration.

Autonomic Nervous System Divisions

The autonomic nervous system is further divided into:

1. **Sympathetic Division:** Prepares the body for 'fight or flight' responses.
2. **Parasympathetic Division:** Promotes 'rest and digest' activities.

Brain Anatomy and Function

Major Parts of the Brain

The brain is divided into several key regions:

1. **Cerebrum:** Responsible for voluntary movement, sensory perception, reasoning, and speech.
2. **Cerebellum:** Coordinates movement and balance.
3. **Brainstem:** Controls vital functions like breathing, heartbeat, and blood pressure.
4. **Diencephalon (Thalamus and Hypothalamus):** Regulates sensory information and homeostatic functions.

Functions of the Cerebral Lobes

Each lobe has specific functions:

1. **Frontal Lobe:** Decision-making, problem-solving, motor skills.
2. **Parietal Lobe:** Sensory processing.
3. **Temporal Lobe:** Auditory processing, memory.
4. **Occipital Lobe:** Visual processing.

Spinal Cord and Reflexes

Structure and Role of the Spinal Cord

The spinal cord transmits signals between the brain and the body and also mediates reflexes. It is protected by vertebrae and surrounded by cerebrospinal fluid.

What Are Reflexes?

Reflexes are rapid, involuntary responses to stimuli, such as pulling your hand away from a hot surface. They involve:

1. Receptor detection
2. Sensory neuron transmission
3. Integration in the spinal cord
4. Motor neuron activation

Common Nervous System Disorders

Neurodegenerative Diseases

Includes conditions like:

1. **Alzheimer's Disease:** Causes memory loss and cognitive decline.
2. **Parkinson's Disease:** Affects movement due to loss of dopamine-producing neurons.

Other Disorders

1. **Multiple Sclerosis:** Immune system attacks myelin sheaths, disrupting nerve signals.
2. **Epilepsy:** Characterized by recurrent seizures caused by abnormal electrical activity.

Anatomy of the Nervous System

The nervous system is a complex network responsible for transmitting signals throughout the body. Its study guide answer key covers fundamental components, including the central nervous system (CNS),

peripheral nervous system (PNS), and their subdivisions.

Central Nervous System (CNS)

The CNS comprises the brain and spinal cord, acting as the control center for processing information. - Brain: Divided into regions such as the cerebrum, cerebellum, brainstem, and limbic system. - Spinal Cord: Transmits signals between the brain and the rest of the body; also involved in reflexes. Key Functions: - Processing sensory information - Initiating motor responses - Regulating bodily functions - Higher functions like reasoning, memory, and emotions Sample Question & Answer: Q: What are the main parts of the brain involved in voluntary movement? A: The primary motor cortex in the cerebrum and the cerebellum are chiefly responsible for voluntary movement coordination.

Peripheral Nervous System (PNS)

The PNS connects the CNS to limbs and organs, facilitating communication between the brain/spinal cord and the rest of the body. - Somatic Nervous System: Controls voluntary movements and reflex arcs. - Autonomic Nervous System: Regulates involuntary functions like heart rate, digestion, and respiratory rate. Autonomic Nervous System Divisions: - Sympathetic Nervous System: Prepares the body for 'fight or flight' responses. - Parasympathetic Nervous System: Promotes 'rest and digest' activities. Sample Question & Answer: Q: Which part of the nervous system is responsible for the "fight or flight" response? A: The sympathetic nervous system, a subdivision of the autonomic nervous system.

Neurons and Neuroglia: Building Blocks of the Nervous System

Understanding the cellular components is crucial for grasping how the nervous system functions.

Neurons

Neurons are specialized cells that transmit electrical impulses. Structure: - Cell Body (Soma): Contains the nucleus and metabolic machinery. - Dendrites: Receive signals from other neurons. - Axons: Transmit impulses away from the cell body; often covered by myelin sheaths. - Axon Terminals: Release neurotransmitters to communicate with target cells. Types of Neurons: 1. Sensory (Afferent) Neurons: Carry signals from sensory receptors to the CNS. 2. Motor (Efferent) Neurons: Send commands from the CNS to muscles or glands. 3. Interneurons: Connect sensory and motor neurons within the CNS. Key Concepts: - Resting potential (~ -70 mV) - Action potential: the electrical impulse that travels along the neuron. - Synaptic transmission: neurotransmitters crossing the synapse to pass signals. Sample Question & Answer: Q: What ion influx causes the depolarization phase of an action potential? A: Sodium (Na^+) ions influx into the neuron causes depolarization.

Neuroglia (Glial Cells)

Support cells that do not transmit impulses but are essential for neuron health. - Types include astrocytes, oligodendrocytes, Schwann cells, microglia, and ependymal cells. - Functions include structural support, insulation (myelination), nutrient transport, immune defense, and cerebrospinal fluid production. Sample Question & Answer: Q: Which glial cells are responsible for forming the myelin

sheath in the central nervous system? A: Oligodendrocytes.

Physiology of Nerve Impulses

The answer key explains how neurons communicate through electrical and chemical signals. Resting Potential and Action Potential - Resting Potential: Maintained by the sodium-potassium pump and membrane permeability, with more K⁺ inside and Na⁺ outside. - Threshold: The critical level (~ -55 mV) that must be reached for an action potential to occur. - Depolarization: Na⁺ channels open, Na⁺ rushes in, membrane potential becomes positive. - Repolarization: K⁺ channels open, K⁺ exits, restoring negative potential. - Hyperpolarization: Slight overshoot, then returns to resting potential. Synaptic Transmission - Action potential reaches axon terminal. - Voltage-gated calcium channels open. - Calcium influx triggers neurotransmitter release. - Neurotransmitters cross the synaptic cleft. - Bind to receptors on postsynaptic neuron, propagating the signal. Sample Question & Answer: Q: What role does calcium play in synaptic transmission? A: Calcium influx into the axon terminal triggers the release of neurotransmitters.
