1. Roots and Rhizomes
2. Barks
3. Leaves
4. Flowers and Inflorescences
5. Fruits and Seeds
6. Whole Plants

Advantages: Simple, rapid identification; aligns with traditional usage.

Limitations: Morphological similarities among different species can lead to misidentification.

1. Anatomical and Microscopic Classification

This involves detailed microscopic examination of plant tissues, including:

1. Cell types and arrangements
2. Presence of specific structures (e.g., trichomes, resin ducts)
3. Vascular tissue characteristics

Application: The University of Babylon employs microscopic analysis to authenticate raw materials, especially when morphological features are ambiguous.

1. Phytochemical-Based Classification

This modern approach groups crude drugs based on their primary chemical constituents, such as:

1. Alkaloids
2. Glycosides
3. Tannins
4. Volatile Oils
5. Flavonoids
6. Resins

Significance: Facilitates understanding of pharmacological activity and standardization.
