Sample Operations Research Multiple Choice Questions and Answers

Below are some representative questions with detailed explanations to illustrate typical MCQs in operations research.

Question 1:

What is the primary objective of linear programming? A) Maximize profit or minimize cost under given constraints B) Find the shortest path in a network C) Determine the optimal stock level D) Calculate the probability of system failure Answer: A) Maximize profit or minimize cost under given constraints Explanation: Linear programming aims to optimize a linear objective function—either maximizing or minimizing—subject to linear equality or inequality constraints. It's widely used in resource allocation, production planning, and transportation problems.

Question 2:

In the context of the transportation problem, what does the Vogel's approximation method help to do? A) Find the initial feasible solution quickly B) Determine the optimal solution directly C) Identify the bottleneck in a network D) Calculate the minimum cost flow Answer: A) Find the initial feasible solution quickly Explanation: Vogel's approximation method (VAM) is a heuristic used to generate a good initial feasible solution for transportation problems. It considers the penalty costs associated with assigning shipments and helps in reducing total transportation costs.

Question 3:

In queuing theory, the M/M/1 model assumes: A) Infinite servers with Poisson arrivals and exponential service times B) Single server with Poisson arrivals and exponential service times C) Multiple servers with deterministic arrivals and constant service times D) Single server with deterministic arrivals and exponential service times Answer: B) Single server with Poisson arrivals and exponential service times Explanation:

The M/M/1 queue is a standard model where arrivals follow a Poisson process, service times are exponentially distributed, and there is only one server. It's used to analyze systems like customer service counters and network routers.

Question 4:

Which method is commonly used to solve integer programming problems? A) Simplex method B) Branch and bound method C) Graphical method D) Gradient descent Answer: B) Branch and bound method Explanation: Integer programming problems require solutions where some or all variables are integers. The branch and bound method systematically explores solution spaces to find the optimal integer solution efficiently.

Question 5:

In the context of the Critical Path Method (CPM), what does the critical path represent? A) The longest path through the project network, determining the minimum project duration B) The shortest path from start to finish in a project network C) The path with the least cost in resource allocation D) The sequence of activities with the highest cost Answer: A) The longest path through the project network, determining the minimum project duration Explanation: The critical path is the sequence of activities that determines the total project duration. Any delay in critical activities directly affects the overall completion time.

Sample Multiple Choice Questions and Expert Analysis

To illustrate the depth and application of MCQs in OR, let's examine some representative questions, along with detailed explanations.

Question 1: Linear Programming Formulation

Which of the following is NOT a standard assumption in linear programming? A) Proportionality between variables and their contribution to the objective function B) Certainty of data C) Non-negativity of decision variables D) Non-linearity of constraints Correct Answer: D) Non-linearity of constraints Expert Explanation: Linear programming (LP) relies on several fundamental assumptions to ensure the problem remains linear and solvable via standard methods like the simplex algorithm. These assumptions include: - Proportionality: The contribution of decision variables to the objective function and constraints must be directly proportional (e.g., coefficients are constants). - Certainty: All data values are known with certainty. - Non-negativity: Decision variables are often constrained to be non-negative, especially in resource allocation problems. Non-linearity of constraints (option D) violates the core linearity principle, making the problem non-linear and requiring different solution approaches. Recognizing this helps in identifying whether a problem is suitable for LP or needs alternative techniques.

Question 2: Transportation Problem

In a balanced transportation problem, the total supply equals the total demand. Which method is typically used to find an initial feasible solution? A) Northwest Corner Method B) Vogel's Approximation Method C) MODI

Method D) Both A and B Correct Answer: D) Both A and B Expert Explanation: For balanced transportation problems, initial feasible solutions are often obtained using: - Northwest Corner Method: A straightforward, heuristic approach starting from the top-left (northwest) cell, allocating as much as possible, then moving either right or down. - Vogel's Approximation Method (VAM): A more refined heuristic that considers penalty costs to find a closer-to-optimal initial solution. The MODI (Modified Distribution) method, on the other hand, is used for optimizing the transportation plan after initial feasibility is achieved. Both the Northwest Corner and VAM are valid initializers, making option D correct.

Question 3: Queueing Theory

In the M/M/1 queue model, the average number of customers in the system (L) is given by which of the following formulas? A) $L = \frac{\lambda}{\mu - \lambda}$ B) $L = \frac{\lambda}{\mu}$ C) $L = \frac{\mu}{\mu - \lambda}$ D) $L = \frac{\lambda}{\mu + \lambda}$ Correct Answer: A) $L = \frac{\lambda}{\mu - \lambda}$ Expert

Explanation: The M/M/1 queue model assumes Poisson arrivals (λ) and exponential service times (μ). The average number of customers in the system, including those being served and waiting, is derived from the steady-state probabilities and is given by: $L = \frac{\rho}{1 - \rho} = \frac{\lambda / \mu}{1 - (\lambda / \mu)} = \frac{\lambda}{\mu - \lambda}$ This formula is fundamental in queueing theory, helping managers estimate system congestion and optimize service rates.

Strategies for Mastering Operations Research MCQs
