## **Sample Biology Biochemistry Multiple Choice Questions with Explanations**

Below are representative questions to help reinforce key concepts. Each question is followed by the correct answer and a detailed explanation.

### **Question 1:**

Which of the following is the primary function of enzymes in biological systems? a) Provide energy for reactions b) Speed up chemical reactions without being consumed c) Store genetic information d) Act as structural components of cells Answer: b) Speed up chemical reactions without being consumed Explanation: Enzymes are biological catalysts that accelerate chemical reactions by lowering activation energy. They are not consumed in the reactions they catalyze, allowing a single enzyme molecule to facilitate multiple reactions. Options a), c), and d) refer to other biological molecules or functions, but the primary role of enzymes is catalysis.

### **Question 2:**

Which biomolecule is primarily responsible for storing genetic information? a) Carbohydrates b) Lipids c) Proteins d) Nucleic acids Answer: d) Nucleic acids Explanation: Nucleic acids, such as DNA and RNA, carry genetic information essential for inheritance and cellular function. Carbohydrates and lipids serve as energy sources and structural components, while proteins perform a wide range of functions but do not

store genetic information.

### **Question 3:**

During the process of glycolysis, which molecule is the end product? a) Pyruvate b) Acetyl-CoA c) Lactic acid d) Ethanol Answer: a) Pyruvate Explanation: Glycolysis is the breakdown of glucose into two molecules of pyruvate. Pyruvate then enters further metabolic pathways such as the citric acid cycle or fermentation, depending on cellular conditions.

### **Question 4:**

Which of the following best describes the structure of a phospholipid? a) Glycerol backbone with three fatty acids b) Glycerol backbone with two fatty acids and a phosphate group c) A single fatty acid chain attached to a glycerol d) A steroid nucleus with four fused rings Answer: b) Glycerol backbone with two fatty acids and a phosphate group Explanation: Phospholipids consist of a glycerol backbone, two fatty acid chains, and a phosphate group. This structure forms the bilayer of cell membranes, providing fluidity and barrier functions.

### **Question 5:**

In DNA, which base pairs with adenine? a) Cytosine b) Guanine c) Thymine d) Uracil Answer: c) Thymine Explanation: In DNA, adenine pairs specifically with thymine via two hydrogen bonds. This complementary base pairing is fundamental to DNA structure and replication.
