Working Principles of the Elcometer 456

Magnetic Induction and Eddy Current Techniques

The Elcometer 456 utilizes two primary techniques to measure dry film thickness:

Magnetic Induction (for Ferrous Metals)

1. When measuring coatings on ferrous substrates, the device employs magnetic induction.
2. A magnetic field is generated by the probe, which penetrates the coating and induces a magnetic response in the substrate.
3. The device calculates the coating thickness based on the magnetic response, which correlates with the distance between the probe and the substrate surface.

Eddy Current (for Non-Ferrous Metals)

1. For non-ferrous substrates such as aluminum, copper, or zinc, the gauge uses eddy current technology.
2. An alternating magnetic field induces eddy currents in the substrate.

3. The device measures the impedance change caused by the coating and substrate interaction to determine thickness.

Calibration and Zeroing

1. Prior to measurement, the device must be calibrated using a standard calibration block or specimen with a known coating thickness.
2. Zeroing the instrument ensures that the measurement starts from a baseline, accounting for any surface irregularities or environmental factors.

Measurement Procedure

1. Select the appropriate mode based on the substrate type.
2. Calibrate the device if necessary.
3. Place the probe firmly against the coated surface, ensuring good contact.
4. Press the measurement button, and wait for the reading to stabilize.
5. Record the measurement, either manually or automatically stored in the device's memory.

Technical Principles Behind the Elcometer 456

Magnetic Induction for Ferrous Substrates

When measuring coatings on ferrous (magnetic) metals such as steel, the elcometer 456 uses the magnetic induction method. The probe generates a magnetic field that penetrates through the coating to the substrate. The thickness of the dry film influences the magnetic flux, and the device interprets these changes to determine the coating's thickness.

1. Highly accurate for ferrous metals
2. Non-destructive
3. Minimal surface preparation required

Eddy Current for Non-Ferrous Substrates

For non-ferrous substrates like aluminum or copper, the elcometer 456 switches to eddy current measurement. The probe induces a high-frequency electromagnetic field that interacts with the conductive substrate beneath the coating. Variations in the eddy current flow relate directly to the coating's thickness.

Benefits of Eddy Current Technique:

1. Suitable for non-ferrous metals
2. Precise and quick readings
3. Reduced interference from surface roughness

The dual-mode capability ensures that the instrument can be used across a wide spectrum of applications, providing flexibility for inspectors working with different materials.
