Questions & Answers About data analyst technical interview questions

No	Question	Answer
1	What is the difference between a clustered and a non-clustered index in SQL?	A clustered index determines the physical order of data in a table, meaning the table data is stored sorted based on the index key. There can be only one clustered index per table. A non-clustered index, on the other hand, creates a separate structure that points to the data rows, allowing multiple non-clustered indexes per table without affecting the physical data order.
2	How do you handle missing or null values in a dataset during analysis?	Handling missing or null values can involve several strategies such as removing rows with nulls, imputing missing values using mean, median, or mode, or using algorithms that support missing values. The choice depends on the data context and the impact on analysis accuracy. It's important to understand why data is missing to choose the most appropriate method.

3	Explain the concept of normalization and denormalization in database design.	Normalization is the process of organizing data to reduce redundancy and improve data integrity by dividing data into related tables. Denormalization involves intentionally introducing redundancy to improve read performance by combining tables or adding redundant data. Both techniques balance data integrity and query efficiency based on application needs.
4	What are some common data visualization tools used by data analysts?	Common data visualization tools include Tableau, Power BI, QlikView, and Looker for interactive dashboards; Python libraries like Matplotlib, Seaborn, and Plotly; and R packages such as ggplot2. The choice depends on the complexity of the visualization, data sources, and user requirements.
5	Describe a situation where you used SQL to solve a complex data problem.	In a previous role, I used SQL to identify customers who made purchases in the last three months but had not engaged with marketing campaigns. I wrote complex JOIN queries to combine transaction and customer engagement tables, used window functions to analyze purchase frequency, and created views to streamline reporting, enabling targeted marketing efforts.
6	What is the purpose of data cleaning, and what are common techniques involved?	Data cleaning aims to improve data quality by correcting errors, removing duplicates, handling missing values, and ensuring consistency. Common techniques include standardizing formats, imputing missing data, removing duplicates, correcting typos, and validating data against known patterns or rules to ensure accurate analysis results.
