Common Questions and Solutions in Physics Unit VII Test V1

Below we examine some typical questions from Physics Unit VII tests and provide detailed answers and explanations.

Question 1: Describe the Properties of Mechanical Waves

Sample Question: What are the main properties of mechanical waves, and how do they differ from electromagnetic waves? Answer: Mechanical waves are disturbances that propagate through a medium (solid, liquid, or gas). Their main

properties include: - Wavelength (λ): The distance between successive crests or troughs. - Frequency (f): Number of wave cycles passing a point per second. - Amplitude: The maximum displacement from the rest position. - Wave Speed (v): How fast the wave travels through the medium, given by $v = f\lambda$. - Speed depends on the medium's properties: Density and elasticity influence wave speed. Differences from Electromagnetic Waves: - Mechanical waves require a medium to travel (e.g., air, water). - Electromagnetic waves (light, radio waves) can travel through a vacuum. - Mechanical waves include sound and seismic waves, while electromagnetic waves include visible light, X-rays, and radio waves.

Question 2: Explain the Doppler Effect and Provide an Example

Sample Question: What is the Doppler effect, and how does it affect the frequency of sound waves? Answer: The Doppler effect refers to the change in frequency (and wavelength) of a wave as observed by an observer moving relative to the source of the wave. - When the source and observer move closer: The observed frequency increases (higher pitch in sound). - When they move apart: The observed frequency decreases (lower pitch). Example: A siren on an ambulance approaches you; the pitch sounds higher as it approaches and lower as it moves away. This change is due to the Doppler effect. Mathematically: $f' = f (v \pm v_o) / (v \mp v_s)$ Where: - f' = observed frequency - f = emitted frequency - v = speed of sound in the medium - v_o = speed of the observer (positive if moving towards the source) - v_s = speed of the source (positive if moving away from the observer)

Question 3: Describe the Laws of Reflection and Refraction

Sample Question: What are the laws of reflection and refraction? Provide examples illustrating each. Answer: Laws of Reflection: - The angle of incidence (θ_i) equals the angle of reflection (θ_r). - The incident ray, reflected ray, and the normal to the surface all lie in the same plane. Example: Light hitting a mirror reflects at the same angle it arrives, enabling images to form. Laws of Refraction: - The incident ray, refracted ray, and the normal all lie in the same plane. - The ratio of the sine of the angle of incidence (θ_i) to the sine of the angle of refraction (θ_r) is constant, given by Snell's Law: $n_1 \sin \theta_i = n_2 \sin \theta_r$ where n_1 and n_2 are the refractive indices of the media. Example: A straw appearing bent in a glass of water is due to refraction, where light changes speed as it passes from air to water.
