Solid Mensuration Problems with Solutions Plane Figures

Introduction

Solid mensuration is a fundamental branch of geometry that deals with the measurement of three-dimensional figures such as cubes, cylinders, cones, spheres, and prisms. These problems are essential for students preparing for competitive exams, engineering entrance tests, and academic assessments, as they help strengthen spatial visualization and calculation skills. While most solid mensuration problems involve three-dimensional objects, their solutions often require a strong understanding of plane figures—two-dimensional shapes like rectangles, triangles, circles, and polygons—that form the bases or cross-sections of these solids. In this article, we will explore various solid mensuration problems involving plane figures, providing comprehensive solutions to enhance understanding. These problems are designed to improve problem-solving abilities, with practical examples and step-by-step explanations, ensuring clarity and confidence in tackling similar questions.

Understanding the Basics of Plane Figures in Mensuration

Before diving into problems, it's crucial to understand the key plane figures involved in mensuration problems:

1. **Rectangle:** A quadrilateral with opposite sides equal and parallel. Its area = length $\times$ breadth.
2. **Square:** A special rectangle with all sides equal. Area = side².
3. **Triangle:** A three-sided figure. Area = $\frac{1}{2} \times$ base $\times$ height.
4. **Circle:** A round shape with radius r . Area = πr^2 ; circumference = $2\pi r$.
5. **Polygon:** A plane figure with many sides, area calculated based on formulas specific to each polygon.

These plane figures serve as the bases or cross-sections of 3D objects. To solve solid mensuration problems, understanding how these plane figures relate to the volume and surface area of solids is essential.

Common Types of Solid Mensuration Problems with Plane Figures

Solid mensuration problems generally fall into the following categories:

1. Calculating volume of solids with plane figures as bases (e.g., cylinders, cones, prisms).
2. Finding surface area when plane figures form the bases or lateral surfaces.
3. Problems involving the intersection of plane figures with solids, such as cross-sectional areas.
4. Composite problems combining multiple solids with plane figures.

Below, we will examine specific problem types with detailed solutions.

Problem 1: Volume of a Cylinder with a Circular Base

Problem Statement

A right circular cylinder has a height of 10 cm and a base radius of 7 cm. Find its volume.

The volume (V) of a cylinder is given by the formula: $V = \pi r^2 h$ where: (r) = radius of the base (h) = height of the cylinder Given: $(r = 7)$ cm $(h = 10)$ cm Calculating: $V = \pi \times 7^2 \times 10 = \pi \times 49 \times 10 = 490\pi$ cubic centimeters Using $(\pi \approx 3.1416)$, we get: $V \approx 490 \times 3.1416 = 1539.84$ cm^3 Answer: The volume of the cylinder is approximately 1539.84 cm^3 .

Problem 2: Volume of a Cone with a Circular Base

Problem Statement

A right circular cone has a height of 12 cm and a base radius of 5 cm. Calculate its volume.

Solution

The volume (V) of a cone is given by: $V = \frac{1}{3} \pi r^2 h$ Given: $(r = 5)$ cm $(h = 12)$ cm Calculating: $V = \frac{1}{3} \pi \times 25 \times 12 = \frac{1}{3} \pi \times 300 = 100\pi$ Using $(\pi \approx 3.1416)$: $V \approx 100 \times 3.1416 = 314.16$ cm^3 Answer: The volume of the cone is approximately 314.16 cm^3 .

Problem 3: Volume of a Right Prism with a Rectangular Base

Problem Statement

A right prism has a rectangular base measuring 8 cm by 5 cm and a height of 10 cm. Find its volume.

Solution

The volume (V) of a prism is: $V = \text{Area of base} \times \text{height}$ Area of the rectangular base: $A = \text{length} \times \text{breadth} = 8 \times 5 = 40$ cm^2 Given height: $(h = 10)$ cm Calculating: $V = 40 \times 10 = 400$ cm^3 Answer: The volume of the prism is 400 cm^3 .

Problem 4: Surface Area of a Sphere with a Great Circle

Problem Statement

A sphere has a radius of 6 cm. Find its surface area.

Solution

The surface area (A) of a sphere: $A = 4 \pi r^2$ Given: $(r = 6)$ cm Calculating: $A = 4 \pi \times 36 = 144 \pi$ Using $(\pi \approx 3.1416)$: $A \approx 144 \times 3.1416 = 452.39$ cm^2 Answer: The surface area of the

sphere is approximately 452.39 cm^2 .

Problem 5: Cross-Section of a Cylinder (Plane Figure)

Problem Statement

A right circular cylinder with a height of 14 cm and radius of 5 cm is cut horizontally at a height of 7 cm from the base. Find the area of the cross-section formed.

Solution

Since the cut is made horizontally at mid-height, the cross-section is a circle with the same radius as the base: $\text{Cross-sectional area} = \pi r^2$ Given $(r = 5)$ cm: $\text{Area} = \pi \times 25 = 25\pi$ Using $(\pi \approx 3.1416)$: $\text{Area} \approx 25 \times 3.1416 = 78.54 \text{ cm}^2$ Answer: The area of the cross-section is approximately 78.54 cm^2 .

Problem 6: Volume of a Frustum of a Cone

Problem Statement

A frustum of a cone has a lower radius of 10 cm, an upper radius of 4 cm, and a height of 12 cm. Find its volume.

Solution

The volume (V) of a frustum: $V = \frac{1}{3} \pi h (r_1^2 + r_2^2 + r_1 r_2)$ where: - $(r_1 = 10)$ cm (lower radius) - $(r_2 = 4)$ cm (upper radius) - $(h = 12)$ cm Calculating: $V = \frac{1}{3} \pi \times 12 (10^2 + 4^2 + 10 \times 4)$ $V = 4\pi (100 + 16 + 40) = 4\pi \times 156 = 624\pi$ Using $(\pi \approx 3.1416)$: $V \approx 624 \times 3.1416 = 1960.76 \text{ cm}^3$

cm³ \] Answer: The volume of the frustum is approximately 1960.76 cm³.

By exploring a broad spectrum of these problems, from basic calculations to complex multi-step solutions, learners can deepen their comprehension of geometric relationships and improve their problem-solving agility. This article aims to provide a comprehensive review of solid mensuration problems involving plane figures, complete with detailed solutions and analytical insights.

Understanding the Fundamentals of Solid Mensuration

Before delving into specific problems, it is essential to establish a clear understanding of the core concepts and formulas that underpin solid mensuration involving plane figures.

What is Solid Mensuration?

Solid mensuration refers to the branch of geometry concerned with the measurement of three-dimensional objects—such as volume, surface area, and other related parameters. It involves calculating these measures for various solids like cylinders, cones, spheres, and prisms, among others. When such calculations are based on or involve plane figures as their bases or cross-sections, they provide a rich ground for problem-solving, integrating 2D and 3D geometrical concepts.

Key Concepts and Formulas

Understanding the fundamental formulas is critical for solving mensuration problems efficiently:

- Cube - Volume = a^3 - Surface Area = $6a^2$
- Cuboid (Rectangular Prism) - Volume = $l \times b \times h$ - Surface Area = $2(lb + bh + hl)$
- Cylinder - Volume = $\pi r^2 h$ - Surface Area = $2\pi r(h + r)$
- Cone - Volume = $(1/3)\pi r^2 h$ - Surface Area = $\pi r(l + r)$, where l is the slant height

Sphere - Volume = $(4/3)\pi r^3$ - Surface Area = $4\pi r^2$ - Prism - Volume = area of base $\times$ height - Surface Area depends on the shape of the base - Pyramid - Volume = $(1/3) \times$ area of base $\times$ height - Surface Area varies depending on the base and lateral faces

Analyzing Problems with Plane Figures as Bases

Many solid mensuration problems involve solids whose bases are plane figures such as triangles, circles, rectangles, or polygons. These problems typically require the application of both plane geometry and spatial reasoning to find volumes, surface areas, or other measurements.

Common Types of Problems

- Calculating the volume of a prism or cylinder with a given base area and height. - Finding the surface area of a cone or pyramid with known dimensions. - Determining the volume of a frustum or truncated cone. - Solving for missing dimensions when given volume and surface area. - Problems involving sections and cross-sections of solids. Each problem type demands a systematic approach—identifying the base figure, applying relevant formulas, and performing precise calculations.

Detailed Examples and Solutions

To illustrate the principles and techniques involved, this section presents detailed solutions to typical solid mensuration problems involving plane figures.

Example 1: Volume of a Right Circular Cylinder

Problem: A right circular cylinder has a radius of 5 cm and a height of 12 cm. Find its volume. Solution: - Step 1: Identify the formula for the volume of a cylinder: $(V = \pi r^2 h)$ - Step 2: Plug in the given values: $(V = \pi \times 5^2 \times 12 = \pi \times 25 \times 12)$ - Step 3: Calculate: $(V = \pi \times 300)$ - Step 4: Approximate using $(\pi \approx 3.1416)$: $(V \approx 3.1416 \times 300 = 942.48 \text{ cm}^3)$ Answer: The volume of the cylinder is approximately 942.48 cubic centimeters.

Example 2: Surface Area of a Cone

Questions & Answers About solid mensuration problems with solutions plane figures

No	Question	Answer
1	How do you find the surface area of a rectangular prism given its length, width, and height?	The surface area of a rectangular prism is calculated using the formula: $2(lw + lh + wh)$, where l is length, w is width, and h is height. Substitute the known values into the formula to find the total surface area.
2	What is the method to calculate the total surface area of a cylinder with given radius and height?	The total surface area of a cylinder is given by $2\pi r(h + r)$, where r is the radius and h is the height. Plug in the known values of r and h to compute the surface area.
3	How can I determine the area of a triangle inscribed in a circle when the lengths of sides are known?	You can use Heron's formula: first, compute the semi-perimeter $s = (a + b + c)/2$, then calculate the area as $\sqrt{s(s - a)(s - b)(s - c)}$. Alternatively, if you know the base and height, use $(1/2) \times \text{base} \times \text{height}$.
4	What is the approach to solve for the volume of a cone with a known radius and height?	Use the formula: $(1/3)\pi r^2 h$, where r is the radius and h is the height. Substitute the given values into this formula to find the volume.
5	How do you calculate the lateral surface area of a sphere?	A sphere does not have a lateral surface area separately; its total surface area is $4\pi r^2$. If the problem asks for a part, ensure whether it refers to the total surface area or a specific segment.
6	When given a composite figure made of plane figures, how do you find its total area?	Break down the composite figure into simpler known shapes (rectangles, triangles, circles, etc.), calculate the area of each, and then sum or subtract as necessary. Ensure all measurements are consistent before adding the areas.
