Introduction to Metal Cutting in Mechanical Engineering

What is Metal Cutting?

Metal cutting is a manufacturing process that involves removing material from a workpiece using a cutting tool to achieve desired shape, size, and surface finish. It is a subtractive process where material is removed in the form of chips.

Types of Metal Cutting Processes

- Turning: Performed on lathes, where a single-point cutting tool removes material from a rotating workpiece. - Milling: Involves a rotating cutter removing material from a stationary workpiece. - Drilling: Creates holes using a rotating drill bit. - Shaping and Planning: Used for creating flat surfaces or specific geometries. - Grinding: For finishing surfaces to achieve high precision.

Fundamental Concepts and Definitions

What is the Cutting Force?

Cutting force is the force exerted by the cutting tool on the workpiece during the metal cutting process. It consists of tangential, radial, and axial components.

Define Shear Plane and Shear Angle

- Shear Plane: The plane along which shear deformation occurs during cutting. - Shear Angle: The angle between the shear plane and the cutting direction; it influences the cutting forces and chip formation.

What is Chip Formation?

Chip formation is the process by which material is removed in the form of chips during cutting. The nature of chips (continuous, discontinuous, or segmented) affects the machining process and surface finish.

Types of Cutting Tools and Materials

Common Cutting Tool Materials

1. High-Speed Steel (HSS)
2. Carbide
3. Cubic Boron Nitride (CBN)
4. Diamond

What are the Characteristics of a Good Cutting Tool?

- High hardness and wear resistance - Toughness - Good thermal stability
- Ease of sharpening and manufacturing

Machining Parameters and Their Significance

What are the Main Machining Parameters?

- Cutting Speed (V): The relative speed between the cutting tool and workpiece.
- Feed (f): The distance the tool advances during one revolution or pass.
- Depth of Cut (d): The thickness of the material removed in one pass.

How do these parameters affect the

machining process?

- Increasing cutting speed generally improves productivity but may lead to higher tool wear. - Higher feed increases material removal rate but may worsen surface finish. - Greater depth of cut enhances productivity but may increase cutting forces and tool stress.

Machining Mechanics and Forces

Explain the Concept of Cutting Forces

Cutting forces are the forces acting on the cutting tool during machining, comprising: - Tangential Force (F_t) - Radial Force (F_r) - Axial Force (F_a)
These forces influence tool life, surface finish, and machining stability.

What is the Relationship Between Cutting Force and Power Consumption?

Power consumption in machining is directly proportional to the cutting forces and cutting speed, expressed as: $P = F_t \times V$ where P is power, F_t is tangential force, and V is cutting speed.

Heat Generation and Tool Wear

Where Does the Heat Come From During Metal Cutting?

The heat is generated mainly due to plastic deformation of the work material and friction between the tool and workpiece.

How Does Heat Affect Tool Life?

Excessive heat accelerates tool wear, causes thermal expansion, and may lead to tool failure. Proper cooling and lubrication are essential to manage heat.

Describe Types of Tool Wear

- Crater Wear: Formation of a wear crater on the rake face. - Flank Wear: Wear on the flank face of the tool. - Built-up Edge (BUE): Accumulation of work material on the tool edge.

Machining Parameters Optimization and Surface Finish

How Does Surface Finish Depend on Machining Parameters?

Surface finish improves with lower feed and depth of cut, higher cutting speeds (up to an optimal point), and proper tool condition.

What is the Role of Cooling and Lubrication?

Cooling reduces heat and friction, prolonging tool life, while lubrication minimizes friction and prevents tool adhesion.

Specialized Topics in Metal Cutting

What are the Different Types of Chips?

- Continuous Chips: Smooth, associated with high-speed machining and good surface finish. - Discontinuous Chips: Fragmented, caused by low ductility or interrupted cutting. - Segmented Chips: Formed due to cyclic shear and strain hardening.

Explain the Concept of Machinability

Machinability refers to the ease with which a material can be machined, considering factors like tool wear, surface finish, and cutting forces.

What Factors Affect Machinability?

- Material properties (hardness, ductility) - Cutting speed and feed - Tool material and geometry - Coolant application

Common Viva Questions and Model Answers

Q1: What is the significance of the shear angle in machining?

Answer: The shear angle influences the ease of cutting and the forces involved. A higher shear angle reduces cutting forces and power consumption, leading to smoother chip flow and better surface finish.

Q2: How does increasing cutting speed affect tool wear?

Answer: Increasing cutting speed generally accelerates tool wear due to higher temperatures at the cutting interface, leading to thermal softening of the tool material and faster deterioration.

Q3: What are the main advantages of carbide tools over high-speed steel?

Answer: Carbide tools offer higher hardness, wear resistance, and can operate at higher cutting speeds, resulting in increased productivity and longer tool life.

Q4: Describe the effect of feed rate on surface finish.

Answer: A higher feed rate tends to worsen surface finish because it results in larger chip thickness and more pronounced tool marks; conversely, a lower feed rate produces a smoother surface.

Q5: Why is proper coolant application important in metal cutting?

Answer: Proper coolant reduces heat generation, minimizes thermal expansion and tool wear, improves surface finish, and prevents tool adhesion and workpiece deformation.

Common Viva Questions in Mechanical Engineering Metal Cutting

Below, we explore key viva questions categorized into fundamental and advanced topics, accompanied by detailed explanations to foster comprehensive understanding.

Fundamental Viva Questions

- 1. What is metal cutting? Describe its significance in manufacturing.**

Metal cutting involves removing material from a workpiece to produce a desired shape or size. It is essential in manufacturing because it

enables mass production of complex components with high precision and surface quality, forming the basis of machining operations such as turning, milling, and drilling.

2. What are the different types of cutting tools used in metal cutting?

Types of cutting tools include:

1. Single-point cutting tools (used in turning)
2. Multi-point tools (used in milling, drilling)
3. Abrasive tools (grinding wheels)
4. Specialized tools (broaches, reamers)

3. Explain the concept of chip formation during metal cutting.

Chip formation is the process where a thin layer of material shears off from the workpiece as the cutting tool advances. Chips can be classified as continuous, segmented, or discontinuous, depending on cutting conditions and material properties. Proper chip control is vital for efficient machining and surface finish.

4. What are the main types of chip formations?

Three primary types include:

1. Continuous chips
2. Segmented or interrupted chips
3. Discontinuous chips

5. Define cutting speed, feed, and depth of cut. How do they influence the machining process?

1. **Cutting speed:** The relative speed between the tool and workpiece, usually expressed in meters per minute (m/min). Higher speeds can improve productivity but may increase tool wear.

2. **Feed:** The distance the tool advances per revolution or per pass, affecting surface finish and production rate.
3. **Depth of cut:** The thickness of material removed in a single pass, influencing cutting forces and tool life.
6. **What is the primary purpose of cutting fluids? Name some commonly used cutting fluids.**

Cutting fluids reduce heat generation, minimize tool wear, lubricate the cutting zone, and help in chip removal. Examples include mineral oils, emulsions, synthetic fluids, and gaseous coolants like compressed air or CO₂.

Advanced and Conceptual Viva Questions

6. **Describe the different types of cutting forces involved in metal cutting.**

The main cutting forces are:
