

AGENT BASED MODELLING AND GEOGRAPHICAL INFORMATION

Agent Based Modelling and Geographical Information In recent years, the integration of agent based modelling (ABM) and geographical information systems (GIS) has revolutionized the way researchers, policymakers, and urban planners analyze complex spatial phenomena. This synergy allows for the simulation of individual behaviors within spatial environments, enabling a deeper understanding of how local interactions influence larger-scale patterns. By combining the dynamic, bottom-up approach of ABM with the spatial precision of GIS, stakeholders can develop more accurate models for urban development, environmental management, transportation planning, and disaster response.

Understanding Agent Based Modelling (ABM)

What is Agent Based Modelling?

Agent based modelling is a computational simulation technique that models the actions and interactions of autonomous agents—such as individuals, organizations, or entities—within a defined environment. Each agent follows a set of rules, making decisions based on their own objectives and perceptions, which collectively produce emergent phenomena observable at the macro level.

Key Components of ABM

- Agents: The autonomous units with specific behaviors. - Environment: The spatial or non-spatial context where agents operate. - Rules: The decision-making logic guiding agent behavior. - Interactions: The communication or influence among agents and between agents and their environment. - Emergence: The overall system behavior resulting from individual agent actions.
