Fundamentals of Radiation Shielding

Effective shielding involves reducing radiation exposure to acceptable levels. It is governed by principles such as attenuation, dose reduction, and the inverse-square law.

Key Concepts

- Attenuation: Decrease in radiation intensity as it passes through a material. - Half-value layer (HVL): The thickness of material needed to reduce the radiation intensity by 50%. - Tenth-value layer (TVL): The thickness needed to reduce radiation by 90%. - Dose equivalent: Measurement of biological effect of radiation, expressed in sieverts (Sv).
