Understanding Feedback Control Systems

What Are Feedback Control Systems?

Feedback control systems are mechanisms that automatically regulate the behavior of a system to achieve desired performance. They work by continuously measuring the system's output and comparing it to a target value or setpoint. Any deviation triggers corrective actions to bring the system back to its desired state.

Components of a Feedback Control System

A typical feedback control system consists of:

1. **Sensor:** Measures the system output.
2. **Controller:** Processes the error signal (difference between setpoint and output) and determines the control action.
3. **Actuator:** Implements the control action on the system.
4. **Plant:** The process or system to be controlled.

Types of Feedback Control Systems

Feedback systems can be categorized into:

1. **Open-Loop Systems:** No feedback; control action is independent of output.
2. **Closed-Loop Systems:** Incorporate feedback for dynamic adjustment based on output measurements.
