Understanding the Basics of Color

What Is Color?

Color is the visual perception produced by the way our eyes interpret different wavelengths of light. When light hits an object, some wavelengths are absorbed while

others are reflected, and our brains interpret these reflected wavelengths as specific colors. The science of color involves understanding the properties of light, pigments, and how humans perceive them.

The Color Spectrum and the Visible Light Spectrum

The visible spectrum ranges from violet to red, encompassing all the colors that the human eye can perceive. This spectrum includes: - Violet - Indigo - Blue - Green - Yellow - Orange - Red Understanding this spectrum helps in designing colors that are vivid, harmonious, or contrasting, depending on the desired effect.

Primary, Secondary, and Tertiary Colors

- Primary Colors: Red, blue, and yellow (traditional) or red, green, and blue (RGB model for digital displays). - Secondary Colors: Created by mixing two primary colors (e.g., orange, green, purple). - Tertiary Colors: Result from mixing primary and secondary colors, producing hues like yellow-orange or blue-green.
