Detailed Breakdown of the 2003 ACS Organic Chemistry Exam Answers

This section provides detailed answers to representative questions from the 2003 exam, explaining concepts step-by-step for clarity.

Question 1: Mechanism of Nucleophilic Addition to Carbonyls

Question: Describe the mechanism of nucleophilic addition to a ketone, such as acetone, and explain why the carbon atom is electrophilic.

Answer: 1. Electrophilicity of the Carbonyl Carbon: The carbon atom in a ketone's carbonyl group is electrophilic due to the polarization of the C=O bond. Oxygen, being more electronegative, pulls electron density away from the carbon, making it electron-deficient and susceptible to nucleophilic attack. 2. Step-by-Step Mechanism: - Step 1: The nucleophile (e.g., a hydride ion from NaBH_4) approaches the electrophilic carbonyl carbon. - Step 2: The lone pair of electrons on the nucleophile forms a new bond with the carbon. - Step 3: The π bond of the carbonyl breaks, and electrons shift onto the oxygen atom, creating an alkoxide ion. - Step 4: Protonation of the alkoxide (e.g., with water or acid) yields the corresponding alcohol. 3. Key Points: - The carbonyl carbon is electrophilic because of polarization. - The reaction proceeds via a nucleophilic addition mechanism. - The overall process converts a ketone into an alcohol.

Question 2: Stereochemistry of Chiral Centers

Question: Determine the configuration (R or S) of the chiral center in 2-butanol. Answer: 1. Identify the Chiral Center: The second carbon in 2-butanol is attached to: - A hydroxyl group (-OH) - A methyl group (-CH_3) - An ethyl group ($\text{-CH}_2\text{CH}_3$) - A hydrogen atom 2. Assign Priorities Based on Atomic Number: - Oxygen (from -OH): highest priority (1) - Carbon attached to ethyl group: next (2) - Carbon attached to methyl group: third (3) - Hydrogen: lowest priority (4) 3. Determine the Configuration: - Orient the molecule so that the lowest priority group (hydrogen) points away. - Trace the path from priority 1 to 2 to 3: - If the path is clockwise, the configuration is R. - If counterclockwise, S. 4. Result: In this case, the path from -OH (1) to $\text{-CH}_2\text{CH}_3$ (2) to -CH_3 (3) is clockwise, so the configuration is R.

Question 3: Spectroscopic Identification of Organic Compounds

Question: How can IR and NMR spectroscopy be used to identify an unknown alcohol? Answer: 1. Infrared (IR) Spectroscopy: - Look for a broad absorption band around $3200\text{--}3600\text{ cm}^{-1}$ indicating O-H stretching. - The intensity and broadness of this peak suggest the presence of an alcohol. - Additional peaks may include C-H stretching near $2800\text{--}3000\text{ cm}^{-1}$. 2. Proton Nuclear Magnetic Resonance (^1H NMR): - The -OH proton often appears as a broad singlet, usually exchangeable with D_2O . - Characteristic chemical shifts for $\text{-CH}_2\text{-}$ and -CH- groups adjacent to the -OH group. - Integration confirms the number of protons. 3. Carbon-13 NMR (^{13}C NMR): - The carbon attached to the hydroxyl group typically appears downfield ($\sim 60\text{--}80\text{ ppm}$). - Other carbons' chemical shifts help determine the structure. Conclusion: By combining IR

data showing the O–H stretch and NMR data indicating hydroxyl-bearing carbons, the presence and position of the alcohol functional group can be confidently identified.
