Detailed Breakdown of Typical Questions from May 2012 Paper 2

Sample Question 1: Atomic Structure and Periodic Trends

Question: Describe how atomic radius varies across a period and down a group in the periodic table. Explain the underlying reasons for these trends. Sample Answer: - Atomic radius decreases across a period from left to right. - This trend occurs because additional protons increase the nuclear charge, pulling electrons closer to the nucleus, despite the electrons being added to the same energy level. - Atomic radius increases down a group because new electron shells are added, increasing the distance between the nucleus and the outermost electrons.

Sample Question 2: Chemical Bonding

Question: Explain the difference between ionic and covalent bonding, including their typical properties. Sample Answer: - Ionic bonding involves the transfer of electrons from a metal to a non-metal, resulting in oppositely charged ions that attract each other. - Covalent bonding involves sharing pairs of electrons between non-metal atoms. - Ionic compounds tend to have high melting points, are brittle, and conduct electricity when molten or dissolved. - Covalent compounds generally have lower melting points and do not conduct electricity in the solid state.

Sample Question 3: Thermodynamics and Kinetics

Question: Calculate the enthalpy change for the reaction using bond enthalpies: $\text{C}_2\text{H}_6 + \frac{7}{2} \text{O}_2 \rightarrow 2 \text{CO}_2 + 3 \text{H}_2\text{O}$
Given bond enthalpies (kJ/mol): - C-H: 412 - C=C: 614 - C=O: 803 - O=O: 498 Answer: - Break all bonds in reactants: C-H bonds in ethane: 6 bonds $\times$ 412 = 2472 O=O bonds: 3.5 bonds $\times$ 498 = 1743
- Form bonds in products: C=O in CO₂: 4 bonds $\times$ 803 = 3212 O-H in H₂O: 6 bonds $\times$ 412 = 2472
Calculate ΔH : $\Delta H = (\text{Bonds broken}) - (\text{Bonds formed}) = (2472 + 1743) - (3212 + 2472) = 4215 - 5684 = -1469 \text{ kJ/mol}$
