Questions & Answers About bank exam numerical ability formulae

N o	Question	Answer
1	What is the formula for calculating the compound interest in numerical ability?	The compound interest formula is $A = P(1 + r/n)^{nt}$, where P = principal amount, r = annual interest rate (in decimal), n = number of times interest is compounded per year, t = time in years, and A = amount after interest. The compound interest earned is $A - P$.
2	How do you calculate the percentage increase or decrease between two numbers?	Percentage change = $[(\text{New Value} - \text{Original Value}) / \text{Original Value}] \times 100\%$. If the result is positive, it's a percentage increase; if negative, a decrease.
3	What is the formula for work and time problems involving speed?	Work = Speed $\times$ Time. For combined work, total work done = sum of individual work rates, and total time = total work / combined rate.
4	How do you find the average of a set of numbers?	Average = Sum of all numbers / Total number of values.
5	What is the formula for calculating profit percentage?	Profit percentage = $(\text{Profit} / \text{Cost Price}) \times 100\%$. Profit = Selling Price - Cost Price.
6	How is the ratio and proportion used in numerical ability questions?	In ratio problems, the relation between quantities is expressed as a ratio, and in proportion problems, the equality of two ratios is used: $a/b = c/d$.
7	What is the formula for simple interest?	Simple Interest = $(\text{Principal} \times \text{Rate} \times \text{Time}) / 100$, where Principal is the initial amount, Rate is annual interest rate, and Time is in years.

8	How do you solve problems involving ages using formulas?	Use the relation: Present age = Past age + elapsed years, and set up equations based on given conditions. Commonly, age problems are solved by forming equations and solving for the unknown age.
9	What is the formula for calculating speed in distance and time problems?	Speed = Distance / Time. To find any unknown, rearrange the formula accordingly.
10	How do you approach problems involving mixtures and allegations?	Use the allegation method to find the ratio of components. The formula is (Higher % - Mean) / (Mean - Lower %) = Quantity of lower percentage / Quantity of higher percentage.
