The neurophysics of electric fields of the brain encompasses a multidisciplinary domain that bridges neuroscience, physics, bioengineering, and computational modeling. This review aims to provide a comprehensive exploration of the underlying principles, measurement techniques, functional implications, and emerging research frontiers associated with brain electric fields.

Introduction to Brain Electric Fields

The brain's electrical activity arises primarily from the movement of ions across neuronal membranes, creating transient electric potentials. When millions of neurons synchronize their activity, these potentials generate measurable electric fields that propagate through the extracellular space. These fields are fundamental to neural communication, enabling the brain to process information, coordinate activity across regions, and generate observable signals such as EEG (electroencephalogram) rhythms. Understanding the neurophysics of these fields involves examining their origin, characteristics, spatial and temporal dynamics, and how they influence and are influenced by neural tissue properties. This insight provides a foundation for interpreting neurophysiological signals, developing brain-computer interfaces, and understanding pathological conditions like epilepsy.

Fundamental Principles of Neural Electric Fields

Sources of Electric Fields in the Brain

The primary sources of electric fields in neural tissue are: - **Neuronal Membrane Currents:** Action potentials and synaptic activity generate ionic currents across neuronal membranes, creating local electrical dipoles. - **Synaptic Transmission:** Excitatory and inhibitory postsynaptic potentials (EPSPs and IPSPs) produce persistent electrical fields. - **Network Synchronization:** Population-level synchronization, such as oscillations, amplifies electric field signals detectable at the macro scale.

Biophysical Basis of Neural Currents

Neuronal currents can be categorized into: - **Transmembrane Currents:** Flows of ions across the membrane, responsible for action potential initiation and propagation. - **Extracellular Currents:** Currents flowing through the extracellular space, which generate measurable electric potentials. - **Current Dipoles:** Oriented pairs of positive and negative charges, which are fundamental units of neural electric sources.
