Human Anatomy and Physiology

This section forms the backbone of the Term 2 work, emphasizing the structure and function of the human body systems.

The Circulatory System

The circulatory system is vital for transporting nutrients, gases, hormones, and waste products throughout the body. It comprises the heart, blood vessels, and blood. Key Components: - Heart: A muscular organ that pumps blood; includes chambers (atria and ventricles), valves, and associated blood vessels. - Blood Vessels: Arteries (carry oxygen-rich blood away from the heart), veins (carry deoxygenated blood back to the heart), and capillaries (sites of nutrient and gas exchange). - Blood: Composed of red blood cells (oxygen transport), white blood cells (immune defense), plasma (fluid medium), and platelets (clotting). Functions and Processes: - Oxygen

Transport: Hemoglobin in red blood cells binds oxygen in the lungs and releases it in tissues. - Nutrient Delivery: Blood carries glucose, amino acids, and fats to body cells. - Waste Removal: Carries carbon dioxide and other waste products to excretory organs. - Immune Response: White blood cells defend against pathogens circulating in the blood. Expert Tip: Understanding the detailed structure-function relationship of the heart and blood vessels is key to explaining how cardiovascular health impacts overall well-being.

Respiratory System

Students explore how the body exchanges gases with the environment, focusing on the lungs, trachea, bronchi, alveoli, and diaphragm. Main Concepts: - Gas Exchange: Occurs in alveoli where oxygen diffuses into the blood and carbon dioxide diffuses out. - Breathing Mechanics: Involves the diaphragm and intercostal muscles creating pressure differences to facilitate inhalation and exhalation. - Respiratory Health: Effects of smoking, pollution, and respiratory diseases like asthma and bronchitis. Application Focus: The link between respiratory efficiency and physical activity, emphasizing the importance of maintaining healthy lungs.
