Definition and Types of Bariatric Surgery

Bariatric surgery encompasses a variety of procedures aimed at facilitating weight loss by altering the digestive system. The most common types include:

1. **Gastric Bypass (Roux-en-Y):** Creates a small stomach pouch and reroutes the small intestine, reducing calorie absorption.
2. **Sleeve Gastrectomy:** Removes a portion of the stomach, resulting in a sleeve-shaped stomach that limits food intake.
3. **Adjustable Gastric Banding:** Places an adjustable band around the upper stomach to restrict food intake.
4. **Biliopancreatic Diversion with Duodenal Switch (BPD/DS):**
A more complex procedure resulting in significant malabsorption.

While all these procedures aim to promote weight loss, they vary in complexity, risk profiles, and long-term outcomes. Oregon clinics primarily perform sleeve gastrectomy and gastric bypass due to their established efficacy and safety profiles.

1. Gastric Bypass (Roux-en-Y Gastric Bypass)

This is one of the most commonly performed bariatric surgeries worldwide and remains a cornerstone of Pebb's offerings in Oregon. It involves creating a small stomach pouch and rerouting the small intestine to this pouch, resulting in reduced food intake and nutrient absorption. Key features include: - Significant long-term weight loss - Improvement or remission of obesity-related comorbidities such as type 2 diabetes, hypertension, and sleep apnea - Proven durability with follow-up studies indicating sustained results over decades
Risks and considerations: - Nutritional deficiencies requiring lifelong supplementation - Potential for dumping syndrome - Need for regular medical follow-up

2. Sleeve Gastrectomy (Gastric Sleeve)

This procedure involves removing a large portion of the stomach, leaving a sleeve-shaped stomach that limits food intake. Advantages include: - Reduced hunger hormones (ghrelin), aiding in appetite control - Lower risk of nutritional deficiencies compared to gastric bypass - Shorter operative time and recovery period
Considerations: - Less malabsorptive than bypass, possibly leading to slightly less weight loss - Suitability depends on individual health factors

3. Adjustable Gastric Banding

While less common today, some patients with specific needs opt for adjustable gastric banding, which employs a band around the upper stomach to restrict food intake. Key points: - Reversible and

adjustable - Less invasive with a quicker recovery - Generally offers less weight loss compared to other procedures Limitations: - Higher rates of long-term failure and reoperation - Requires patient commitment to follow-up adjustments

4. Biliopancreatic Diversion with Duodenal Switch (BPD/DS) For patients with severe obesity or those needing more aggressive intervention, Pebb offers BPD/DS, a complex procedure combining sleeve gastrectomy with intestinal rerouting. Highlights: - Highest potential for weight loss - Significant remission of metabolic conditions - More intensive nutritional management required
