Now, let's delve into some of the key vocabulary terms from Chapter 15, along with their definitions and explanations.

Core Vocabulary Terms from Biology Chapter 15

1. DNA (Deoxyribonucleic Acid)

DNA is the hereditary material in almost all living organisms. It contains the instructions necessary for the growth, development, and reproduction of cells. DNA is composed of nucleotide sequences that encode genetic information.

2. Gene

A gene is a segment of DNA that codes for a specific protein or RNA molecule. Genes are the basic units of heredity and are responsible for inherited traits.

3. Chromosome

Chromosomes are long, thread-like structures composed of DNA and proteins. They carry genetic information in the form of genes. In humans, each cell typically contains 46 chromosomes.

4. Allele

An allele is a variant form of a gene. Different alleles can produce different traits; for example, the gene for eye color has multiple alleles such as brown, blue, or green.

5. Homozygous

Homozygous refers to having two identical alleles for a particular gene (e.g., AA or aa). Homozygous individuals will express the trait associated with that allele.

6. Heterozygous

Heterozygous describes having two different alleles for a gene (e.g., Aa). The dominant allele often determines the phenotype in heterozygous individuals.

7. Dominant and Recessive Traits

- Dominant trait: a trait that is expressed when at least one dominant allele is present. - Recessive trait: a trait that is only expressed when both alleles are recessive.

8. Phenotype

The phenotype is the observable physical or physiological characteristics of an organism resulting from its genotype.

9. Genotype

The genotype refers to the genetic makeup of an organism; the specific alleles an individual possesses.

10. Punnett Square

A Punnett square is a diagram used to predict the probable genotypes and phenotypes of offspring from a particular cross or mating.

Advanced Concepts and Vocabulary in Chapter 15

11. Mendelian Inheritance

Refers to the patterns of inheritance first described by Gregor Mendel, involving dominant and recessive alleles and predictable ratios in offspring.

12. Codominance

A form of inheritance where both alleles in a heterozygous individual are fully expressed, such as in the case of AB blood type.

13. Incomplete Dominance

Occurs when heterozygous individuals have a phenotype that is a blend of the dominant and recessive traits (e.g., pink flowers from red and white parents).

14. Polygenic Traits

Traits controlled by two or more genes, often resulting in a wide range of phenotypes, such as skin color or height.

15. Genetic Linkage

Refers to genes located close to each other on the same chromosome, which tend to be inherited together.

16. Mutation

A change in the DNA sequence that can be beneficial, neutral, or harmful. Mutations are a source of genetic variation.

17. Natural Selection

The process by which individuals with advantageous traits are more likely to survive and reproduce, leading to evolution over generations.

18. Evolution

The change in the genetic makeup of a population over time, driven by mechanisms like natural selection, mutation, gene flow, and genetic drift.

19. Genetic Drift

Random changes in allele frequencies within a small population, which can lead to significant genetic changes over time.

20. Speciation

The formation of new and distinct species in the course of evolution, often due to geographic or reproductive isolation.
