Overview of Signals and Systems

Introduction to Signals

Signals are functions that convey information about the behavior or attributes of a phenomenon. They are the primary means through which information is transmitted, processed, and stored in engineering systems. In Gurung's book, signals are categorized based on various parameters:

1. **Continuous-time signals:** Defined for every instant of time (e.g., sine waves, exponential signals).
2. **Discrete-time signals:** Defined only at discrete instances (e.g., digital audio signals).
3. **Deterministic signals:** Known exactly at all times.

4. **Random signals:** Exhibiting uncertainty, modeled statistically.

Understanding these classifications helps in choosing appropriate analysis techniques and system models.

Introduction to Systems

A system is any process or device that produces an output signal in response to an input signal. Gurung emphasizes the importance of analyzing systems to predict their behavior, design filters, and control mechanisms. Key properties discussed include:

1. **Linearity:** A system where the principle of superposition applies.
2. **Time-invariance:** System properties do not change over time.
3. **Causality:** Output depends only on present and past inputs.
4. **Stability:** Bounded inputs produce bounded outputs.

The book explores various system representations, including differential equations for continuous systems and difference equations for discrete systems.
