Fundamental Principles Behind ANSYS Fluent

Understanding the core principles that underpin ANSYS Fluent provides insight into its capabilities and limitations. At its essence, Fluent employs numerical methods to solve the governing equations of fluid motion and heat transfer, translating physical laws into computational algorithms.

Governing Equations

ANSYS Fluent models fluid behavior based on the Navier-Stokes equations, which describe the conservation of mass, momentum, and energy:

- Continuity Equation (Mass Conservation): $\frac{\partial \rho}{\partial t} + \nabla \cdot (\rho \mathbf{u}) = 0$
- Momentum Equations: $\rho \frac{\partial \mathbf{u}}{\partial t} + \rho (\mathbf{u} \cdot \nabla) \mathbf{u} = -\nabla p + \nabla \cdot \boldsymbol{\tau} + \mathbf{f}$
- Energy Equation: $\frac{\partial (\rho e)}{\partial t} + \nabla \cdot (\rho e \mathbf{u}) = -\nabla \cdot \mathbf{q} + \Phi + S$

Where ρ is density, $\mathbf{u}$ velocity vector, p pressure, $\boldsymbol{\tau}$ viscous stresses, e energy, $\mathbf{q}$ heat flux, Φ viscous dissipation, and S source terms. ANSYS Fluent discretizes these equations over a computational mesh, transforming continuous partial differential equations into algebraic equations solvable via iterative numerical methods.

Numerical Methods

- Finite Volume Method (FVM): The backbone of Fluent's solver, FVM integrates the governing equations over discrete control volumes, ensuring conservation laws hold locally.
- Discretization Schemes: Fluent

offers various schemes (upwind, central difference, QUICK, etc.) to approximate fluxes, balancing accuracy and stability. - Turbulence Modeling: To simulate turbulent flows efficiently, Fluent incorporates models such as $k-\epsilon$, $k-\omega$, Large Eddy Simulation (LES), and Detached Eddy Simulation (DES). - Solution Algorithms: Pressure-velocity coupling is handled via algorithms like SIMPLE, PISO, and Coupled, optimally selecting methods based on flow complexity.

Physical Models and User-Defined Features

ANSYS Fluent supports an extensive array of physical models, including:

- Multiphase flows (liquid-liquid, gas-liquid, solid particles)
- Combustion and chemical reactions
- Heat transfer via conduction, convection, and radiation
- Magnetohydrodynamics (MHD)
- Moving and deforming meshes for dynamic simulations

Users can customize simulations through User-Defined Functions (UDFs), scripting, and custom boundary conditions, enhancing Fluent's flexibility.
